Research Interests

Schur Rings, Algebraic Combinatorics, Group Theory, Semigroups, Applied Algebra, Associative Rings, Representation Theory, Group Algebras, Algebraic Voting Theory, Algebraic Coding Theory, Applied Linear Algebra, Machine Learning, Data Science.

My specific expertise and research field lies in group theory, associative rings, representation theory, and algebraic combinatorics. In particular, my research focuses on the topics of group rings, group algebras, and their generalizations. For me, the study of group algebras is a playground where many branches of algebra come to play.

"Besides the obvious relationship with group theory and ring theory, the study of group rings involves the theory of fields, linear algebra and algebraic number theory. It should be noted that group rings are also related to algebraic topology, homological algebra, and algebraic K-theory. More recently, they have found applications in algebraic coding theory. Hence, the theory of group rings provides a subject where many branches of algebra come to a rich interplay." – C. Milies and S. Sehgal

I am especially interested in the topic of Schur Rings (or S-rings), which are special subalgebras of group rings afforded by partitions of the group and have applications in combinatorics, graph theory, statistical and combinatorial design theory, and character theory. New efforts made by my collaborators and myself indicate that Schur rings might be a useful tool to extend many combinatorial and design problems into infinite settings, such as random walks on infinite graphs, and may have interesting applications to coding theory and fast Fourier transforms. Schur rings were originally explored by Schur and Wielandt back in the 1930's to study permutation groups.
